

The Whole Enochian Dictionary

Introduction

Do what thou wilt shall be the whole of the Law.

The Grand Experiment in the Enochian language is begun. Using etymological and qabalistic techniques to solve some of the mysteries of this language has proven to be highly rewarding. Starting off this Enochian Dictionary, we've downloaded a host of information from Wikipedia in order to educate and prepare the reader for the creative process that is to follow. Large examples of the techniques used to create this word can be found in the AOM's translations of Liber Loagaeth and further detailed in Liber Ged; of AOM origin.

We've also included Aaron Lietch's excellent essay on the Enochian language and Patricia Shaffer's Letter Essences in order to create a more complete compendium for the serious student of this language.

The Problem of the Schuelers Translation

The Holy Table of Practice has been translated previously by published authors whose works are infamously riddled with errors. There is no worse example of this than the translations of the Holy Table and Table of 12. Here the Schuelers literally make up definitions for words without any rationale at all; as if they're inventing their own game. This is really no worse than the creative yet, ridiculous efforts of the Golden Dawn to "truncate" the squares of the Elemental Tablets. And these irrational efforts only confound the effectiveness of this Magick.

The translations here have been carefully produced by strict etymological and qabalistic practices outlined in the AOM's Liber Ged and as well, the production in Liber Loagaeth. And unlike the Schuelers, great care has been taken to explain how these translations have been produced, that the thorough student can claim confidence in his or her findings in this work.

Love is the law, love under will.

Enochian Grammar

Linguistics is the scientific study of language, which can be theoretical or applied. Someone who engages in this study is called a **linguist**.

Theoretical (or general) linguistics encompasses a number of sub-fields, such as the study of language structure (grammar) and meaning (semantics). The study of grammar encompasses morphology (formation and alteration of words) and syntax (the rules that determine the way words combine into phrases and sentences). Also a part of this field are phonology, the study of sound systems and abstract sound units, and phonetics, which is concerned with the actual properties of speech sounds (phones), non-speech sounds, and how they are produced and perceived.

Linguistics compares languages (comparative linguistics) and explores their histories, in order to find universal properties of language and to account for its development and origins (historical linguistics).

Theoretical linguistics is the branch of linguistics that is most concerned with developing models of linguistic knowledge. Part of this endeavor involves the search for and explanation of linguistic universals, that is, properties all languages have in common. The fields that are generally considered the core of theoretical linguistics are syntax, phonology, morphology, and semantics. Although phonetics often informs phonology, it is often excluded from the purview of theoretical linguistics, along with psycholinguistics and sociolinguistics.

A **linguistic universal** is a statement that is true for all natural languages. For example, *All languages have nouns and verbs*, or *All spoken languages have consonants and vowels*. Research in this area of linguistics is closely tied to linguistic typology, and intends to reveal information about how the human brain processes language. The field was largely pioneered by the linguist Joseph Greenberg, who from a set of some thirty languages derived a set of basic universals, mostly dealing with syntax.

Linguistic typology is a subfield of linguistics that studies and classifies languages according to their structural features. Its aim is to describe and explain the structural diversity of the world's languages. It includes three subdisciplines: Qualitative typology deals with the issue of comparing languages and within-language variance, Quantitative typology deals with the distribution of structural patterns in the world's languages, and Theoretical typology explains these distributions.

In linguistics, **syntax** (from Ancient Greek συν- *syn-*, “together”, and τάξις *táxis*, “arrangement”) is the study of the rules that govern the structure of sentences, and which determine their relative grammaticality. The term *syntax* can also be used to refer to these rules themselves, as in “the syntax of a language”. Modern research in syntax attempts to describe languages in terms of such rules, and, for many practitioners, to find general rules that apply to all languages. Since the field of syntax attempts to explain grammaticality judgments, and not provide them, it is unconcerned with linguistic prescription.

Though all theories of syntax take human language as their object of study, there are some significant differences in outlook. Chomskian linguists see syntax as a branch of psychology, since they conceive syntax as the study of linguistic knowledge. Others (e.g. Gerald Gazdar) take a more Platonistic view, regarding syntax as the study of an abstract formal system.

Phonology (Greek φωνή (*phōnē*), voice, sound + λόγος (*lógos*), word, speech, subject of discussion), is a subfield of linguistics which studies the sound system of a specific language (or languages). Whereas phonetics is about the physical production and perception of the sounds of speech, phonology describes the way sounds function within a given language or across languages.

An important part of phonology is studying which sounds are distinctive units within a language. In English, for example, /p/ and /b/ are distinctive units of sound, (i.e., they are *phonemes* / the difference is *phonemic*, or *phonematic*). This can be seen from minimal pairs such as "pin" and "bin", which mean different things, but differ only in one sound. On the other hand, /p/ is often pronounced differently depending on its position relative to other sounds, yet these different pronunciations are still considered by native speakers to be the same "sound". For example, the /p/ in "pin" is aspirated while the same phoneme in "spin" is not. In some other languages, for example Thai and Quechua, this same difference of aspiration or non-aspiration does differentiate phonemes.

In addition to the minimal meaningful sounds (the phonemes), phonology studies how sounds alternate, such as the /p/ in English described above, and topics such as syllable structure, stress, accent, and intonation.

The principles of phonological theory have also been applied to the analysis of sign languages, even though the phonological units are not acoustic. The principles of phonology, and for that matter, language, are independent of modality because they stem from an abstract and innate grammar.

Morphology is the field within linguistics that studies the internal structure of words. (Words as units in the lexicon are the subject matter of lexicology.) While words are generally accepted as being (with clitics) the smallest units of syntax, it is clear that in most (if not all) languages, words can be related to other words by rules. For example, English speakers recognize that the words *dog*, *dogs*, and *dog-catcher* are closely related. English speakers recognize these relations from their tacit knowledge of the rules of word-formation in English. They intuit that *dog* is to *dogs* as *cat* is to *cats*; similarly, *dog* is to *dog-catcher* as *dish* is to *dishwasher*. The rules understood by the speaker reflect specific patterns (or regularities) in the way words are formed from smaller units and how those smaller units interact in speech. In this way, morphology is the branch of linguistics that studies patterns of word-formation within and across languages, and attempts to formulate rules that model the knowledge of the speakers of those languages.

Semantics (Greek *sēmantikos*, giving signs, significant, symptomatic, from *sēma* (σῆμα), sign) refers to the aspects of meaning that are expressed in a language, code, or other form of representation of information. Semantics is contrasted with two other aspects of meaningful expression, namely, *syntax*, the construction of complex signs from simpler signs, and *pragmatics*, the practical use of signs by agents or communities of interpretation in particular circumstances and contexts. By the usual convention that calls a study or a theory by the name of its subject matter, *semantics* may also denote the theoretical study of meaning in systems of signs.

Though terminology varies, writers on the subject of meaning generally recognize two sorts of meaning that a significant expression may have: (1) the relation that a sign has to objects and objective situations, actual or possible, and (2) the relation that a sign has to other signs, most especially the sorts of mental signs that are conceived of as *concepts*.

Most theorists refer to the relation between a sign and its objects, as always including any manner of objective reference, as its *denotation*. Some theorists refer to the relation between a sign and the signs that serve in its practical interpretation as its *connotation*, but there are many more differences of opinion and distinctions of theory that are made in this case. Many theorists, especially in the formal semantic, pragmatic, and semiotic traditions, restrict the application of *semantics* to the denotative aspect, using other terms or completely ignoring the connotative aspect.

Phonetics (from the Greek word φωνή, *phone* meaning 'sound, voice') is the study of the sounds of human speech. It is concerned with the actual properties of speech sounds (phones), and their production, audition and perception, as opposed to phonology, which is the study of sound systems and abstract sound units (such as phonemes and distinctive features). Phonetics deals with the sounds themselves rather than the contexts in which they are used in languages. Discussions of meaning (semantics) do not enter at this level of linguistic analysis.

Phonetics has three main branches:

- articulatory phonetics, concerned with the positions and movements of the lips, tongue, vocal tract and folds and other speech organs in producing speech;
- acoustic phonetics, concerned with the properties of the sound waves and how they are received by the inner ear; and
- auditory phonetics, concerned with speech perception, principally how the brain forms perceptual representations of the input it receives.

There are over a hundred different phones recognized as distinctive by the International Phonetic Association (IPA) and transcribed in their International Phonetic Alphabet.

Phonetics was studied as early as 2,500 years ago in ancient India, with Pāṇini's account of the place and manner of articulation of consonants in his 5th century BCE treatise on Sanskrit. The major Indic alphabets today, except Tamil script, order their consonants according to Pāṇini's classification.

Psycholinguistics or **psychology of language** is the study of the psychological and neurobiological factors that enable humans to acquire, use, and understand language. Initial forays into psycholinguistics were largely philosophical ventures, due mainly to a lack of cohesive data on how the human brain functioned. Modern research makes use of biology, neuroscience, cognitive science, and information theory to study how the brain processes language. There are a number of subdisciplines; for example, as non-invasive techniques for studying the neurological workings of the brain become more and more widespread, *neurolinguistics* has become a field in its own right.

Psycholinguistics covers the cognitive processes that make it possible to generate a grammatical and meaningful sentence out of vocabulary and grammatical structures, as well as the processes that make it possible to understand utterances, words, text, etc. Developmental psycholinguistics studies infants' and children's ability to learn language, usually with experimental or at least quantitative methods (as opposed to naturalistic observations such as those made by Jean Piaget in his research on the development of children).

Sociolinguistics is the study of the effect of any and all aspects of [society](#), including cultural norms, expectations, and context, on the way [language](#) is used. Sociolinguistics overlaps to a considerable degree with [pragmatics](#).

It also studies how [lects](#) differ between groups separated by certain [social variables](#), e.g., [ethnicity](#), [religion](#), [status](#), [gender](#), level of [education](#), etc., and how creation and adherence to these rules is used to categorize individuals in [social class](#) or [socio-economic classes](#). As the usage of a language varies from place to place ([dialect](#)), language usage varies among social classes, and it is these [sociolects](#) that sociolinguistics studies.

The social aspects of language was in the modern sense first studied by Indian and Japanese linguists in the 1930s, but did not receive much attention in the West until much later. Sociolinguistics in the west first appeared in the 1960s and was pioneered by linguists such as [William Labov](#) in the US and [Basil Bernstein](#) in the UK.

Grammar is the study of rules governing the use of language. The set of rules governing a particular language is the grammar of that language; thus, each language can be said to have its own distinct grammar. Note that the word grammar has two meanings here: the first is the inner rules themselves and the second is our description and study of those rules. When a grammar is fully explicit about all possible construction of a specific language it is called generative grammar. A particular type of generative grammar that has become the leading framework in modern linguistics is transformational grammar which was first proposed by Noam Chomsky.

Grammar is part of the general study of language called [linguistics](#). Grammar is a way of thinking about language.

As the word is understood by most modern linguists, the subfields of grammar are [phonetics](#), [phonology](#), [orthography](#), [morphology](#), [syntax](#), [semantics](#), and [pragmatics](#). Traditionally, however, grammar included only [morphology](#) and [syntax](#).

In linguistics, generative grammar generally refers to a [proof-theoretic](#) framework for the study of [syntax](#) partially inspired by [formal grammar](#) theory and pioneered by [Noam Chomsky](#). A generative grammar is a set of rules that [recursively](#) "specify" or "generate" the well-formed expressions of a [natural language](#). This encompasses a large set of different approaches to grammar. The term *generative grammar* is also broadly used to refer to the school of linguistics where this type of formal grammar plays a major part, including:

- The Standard Theory (ST) (also widely known as [Transformational grammar](#) (TG))
- The Extended Standard Theory (EST) (also widely known as [Transformational grammar](#) (TG))
- [Principles and Parameters Theory](#) (P&P) which includes both [Government and Binding Theory](#) (GB) and the [Minimalist Program](#) (MP)
- [Relational Grammar](#) (RG)
- [Lexical-functional Grammar](#) (LFG)
- [Generalized Phrase Structure Grammar](#) (GPSG)
- Head-Driven Phrase Structure Grammar (HPSG)

Generative grammar should be distinguished from traditional [grammar](#), which is often strongly [prescriptive](#) rather than purely descriptive, is not mathematically explicit, and has historically investigated a relatively narrow set of syntactic phenomena. In the "school of linguistics" sense it should be distinguished from other linguistically descriptive approaches to grammar, such as various [functional](#) theories.

The term *generative grammar* can also refer to a particular set of formal rules for a particular language; for example, one may speak of a *generative grammar of English*. A generative grammar in this sense is a formal device that can enumerate ("generate") all and only the grammatical sentences of a language. In an even narrower sense, a generative grammar is a formal device (or, equivalently, an algorithm) that can be used to decide whether any given sentence is grammatical or not.

In most cases, a generative grammar is capable of generating an infinite number of strings from a finite set of rules. These properties are desirable for a model of natural language, since human brains are of finite capacity, yet humans can generate and understand a very large number of distinct sentences. Some linguists go so far as to claim that the set of grammatical sentences of any natural language is indeed infinite.

Generative grammars can be described and compared with the aid of the [Chomsky hierarchy](#) proposed by Noam Chomsky in the [1950s](#). This sets out a series of types of formal grammars with increasing expressive power. Among the simplest types are the [regular grammars](#) (type 3); Chomsky claims that regular grammars are not adequate as models for human language, because all human languages allow the embedding of strings within strings in an hierarchical way.

At a higher level of complexity are the [context-free grammars](#) (type 2). The derivation of a sentence by a context-free grammar can be depicted as a derivation [tree](#). Linguists working in generative grammar often view such derivation trees as a primary object of study. According to this view, a sentence is not merely a string of [words](#), but rather a tree with subordinate and superordinate branches connected at nodes.

Essentially, the tree model works something like this example, in which S is a sentence, D is a [determiner](#), N a [noun](#), V a [verb](#), NP a [noun phrase](#) and VP a [verb phrase](#):

The resulting sentence could be *The dog ate the bone*. Such a tree diagram is also called a [phrase marker](#). They can be represented more conveniently in a text form, (though the result is less easy to read); in this format the above sentence would be rendered as: [s [NP [D The] [N dog]] [VP [V ate] [NP [D the] [N bone]]]]

However, Chomsky at some point argued that phrase structure grammars are also inadequate for describing natural languages. To address this, Chomsky formulated the more complex system of [transformational grammar](#).

When generative grammar was first proposed, it was widely hailed as a way of formalizing the implicit set of rules a person "knows" when they know their native language and produce grammatical utterances in it. However Chomsky has repeatedly rejected that interpretation; according to him, the grammar of a language is a statement of what it is that a person has to know in order to recognise an utterance as grammatical, but not a hypothesis about the processes involved in either understanding or producing language. In any case the reality is that most native speakers would reject many sentences produced even by a phrase structure grammar. For example, although very deep embeddings are allowed by the grammar, sentences with deep embeddings are not accepted by listeners, and the limit of acceptability is an empirical matter that varies between individuals, not something that can be easily captured in a formal grammar. Consequently, the influence of generative grammar in empirical [psycholinguistics](#) has declined considerably.

Generative grammar has been used in [music theory](#) and [analysis](#) such as by [Fred Lerdahl](#) and in [Schenkerian analysis](#). See: [Chord progression#Rewrite rules](#).

Automata theory : formal languages and formal grammars			
Chomsky hierarchy	Grammars	Languages	Minimal automaton
Type-0	Unrestricted	Recursively enumerable	Turing machine
n/a	(no common name)	Recursive	Decider
Type-1	Context-sensitive	Context-sensitive	Linear-bounded
n/a	Indexed	Indexed	Nested stack
n/a	Tree-adjoining	Mildly context-sensitive	Thread
Type-2	Context-free	Context-free	Nondeterministic Pushdown
n/a	Deterministic Context-free	Deterministic Context-free	Deterministic Pushdown
Type-3	Regular	Regular	Finite

Each category of languages or grammars is a [proper subset](#) of the category directly above it.

Proof theory is a branch of mathematical logic that represents [proofs](#) as formal mathematical objects, facilitating their analysis by mathematical techniques. Proofs are typically presented as inductively-defined [data structures](#) such as plain lists, boxed lists, or trees, which are constructed according to the [axioms](#) and [rules of inference](#) of the logical system. As such, proof theory is [syntactic](#) in nature, in contrast to [model theory](#), which is [semantic](#) in nature. Together with [model theory](#), [axiomatic set theory](#), and [recursion theory](#), proof theory is one of the so-called *four pillars* of the [foundations of mathematics](#).

Proof theory can also be considered a branch of [philosophical logic](#), where the primary interest is in the idea of a [proof-theoretic semantics](#), an idea which depends upon technical ideas in [structural proof theory](#) to be feasible.

Philosophical logic is the study of the more specifically philosophical aspects of logic. The term contrasts with [mathematical logic](#), and since the development of mathematical logic in the late nineteenth century, it has come to include most of those topics traditionally treated by [logic](#) in general. It is concerned with characterising notions like inference, rational thought, truth, and contents of thoughts, in the most fundamental ways possible, and trying to model them using modern formal logic.

The notions in question include [reference](#), [predication](#), [identity](#), [truth](#), [negation](#), [quantification](#), [existence](#), [necessity](#), [definition](#) and [entailment](#).

Philosophical logic is *not* concerned with the psychological processes connected with thought, or with emotions, images and the like. It is concerned only with those entities — thoughts, sentences, or propositions — that are capable of being true and false. To this extent, though, it does intersect with [philosophy of mind](#) and [philosophy of language](#). [Gottlob Frege](#) is regarded by many as the founder of modern philosophical logic.

Not all philosophical logic, however, applies formal logical techniques. A good amount of it (including Grayling's and [Colin McGinn](#)'s books cited below) is written in natural language. One definition, popular in Britain, is that philosophical logic is the attempt to solve general philosophical problems that arise when we use or think about formal logic: problems about existence, necessity, analyticity, [a prioricity](#), propositions, identity, predication, truth. Philosophy of logic, on the other hand, would tackle [metaphysical](#) and [epistemological](#) problems about entailment, validity, and proof.

Proof-theoretic semantics is an approach to the [semantics of logic](#) that attempts to locate the meaning of propositions and logical connectives not in terms of interpretations, as in [Tarskian](#) approaches to semantics, but in the role that the proposition or logical connective plays within the system of inference.

[Gerhard Gentzen](#) is the founder of proof-theoretic semantics, providing the formal basis for it in his account of [cut-elimination](#) for the [sequent calculus](#), and some provocative philosophical remarks about locating the meaning of logical connectives in their introduction rules within [natural deduction](#). It is not a great exaggeration that the history of proof-theoretic semantics since then has been devoted to exploring the consequences of these ideas.

[Dag Prawitz](#) extended Gentzen's notion of [analytic proof](#) to [natural deduction](#), and suggested that the value of a proof in natural deduction may be understood as its normal form. This idea lies at the basis of the [Curry-Howard isomorphism](#), and of [intuitionistic type theory](#). His [inversion principle](#) lies at the heart of most modern accounts of proof-theoretic semantics.

[Michael Dummett](#) introduced the very fundamental idea of [logical harmony](#), building on a suggestion of [Nuel Belnap](#). In brief, a language, which is understood to be associated with certain patterns of inference, has logical harmony if it is always possible to recover analytic proofs from arbitrary demonstrations, as can be shown for the sequent calculus by means of cut-elimination theorems and for natural deduction by means of normalisation theorems. A language that lacks logical harmony will suffer from the existence of incoherent forms of inference: it will likely be inconsistent.

In [computer science](#) and [linguistics](#), a **formal grammar**, or sometimes simply **grammar**, is a precise description of a [formal language](#) — that is, of a [set](#) of [strings](#). The two main categories of formal grammar are that of *generative grammars*, which are sets of rules for how strings in a language can be generated, and that of *analytic grammars*, which are sets of rules for how a string can be analyzed to determine whether it is a member of the language. In short, an analytic grammar describes how to *recognize* when strings are members in the set, whereas a generative grammar describes how to *write* only those strings in the set.

In [mathematics](#), [logic](#), and [computer science](#), a **formal language** is a language that is defined by precise mathematical or machine processable formulas. Like languages in [linguistics](#), formal languages generally have two aspects:

- the [syntax](#) of a language is what the language looks like (more formally: the set of possible expressions that are valid utterances in the language)
- the [semantics](#) of a language are what the utterances of the language mean (which is formalized in various ways, depending on the type of language in question)

Comparative linguistics (originally **comparative philology**) is a branch of [historical linguistics](#) that is concerned with comparing languages in order to establish their historical relatedness. Languages may be related by convergence through borrowing or by genetic descent.

Genetic relatedness implies a common origin or [proto-language](#), and comparative linguistics aims to construct language families, to reconstruct proto-languages and specify the changes that have resulted in the documented languages. In order to maintain a clear distinction between attested and reconstructed forms, comparative linguists prefix an asterisk to any form that is not found in surviving texts.

A **proto-language** is a [language](#) which was the common ancestor of related languages that form a [language family](#). The [German](#) term *Ursprache* (derived from the prefix [Ur-](#) "primordial" and *Sprache* "language") is occasionally used as well.

In most cases, the ancestral proto-language is not known directly and it has to be [reconstructed](#) by comparing different members of the language family via a technique called the [comparative method](#). Through this process only a part of the proto-language's structure and vocabulary can be reconstructed; the reconstruction remains the more fragmentary the more ancient the proto-language in question relative to the number of its descendants. Examples of unattested but (partially) reconstructed proto-languages include [Proto-Indo-European](#), [Proto-Uralic](#), [Proto-Bantu](#) and [Proto-Paman](#). Sometimes, however, the proto-language is a language which is known from inscriptions, an example being the [Proto-Norse language](#) attested in the [Elder Futhark runic inscriptions](#), or very well-known, such as [Latin](#) ("Proto-Italic").

Historical linguistics (also **diachronic linguistics**) is the study of language change. It has five main concerns:

- to describe and account for observed changes in particular languages;
- to reconstruct the pre-history of languages and determine their relatedness, grouping them into [language families](#) ([comparative linguistics](#));
- to develop general theories about how and why language changes;
- to describe the history of [speech communities](#);
- to study the history of words, i.e., [etymology](#).

Etymology is the study of the [history](#) of [words](#) - when they entered a language, from what source, and how their form and meaning have changed over time.

In languages with a long written history, etymology makes use of [philology](#), the study of how words change from culture to culture over time. However, etymologists also apply the methods of [comparative linguistics](#) to reconstruct information about languages that are too old for any direct information (such as writing) to be known. By analyzing related languages with a technique known as the [comparative method](#), linguists can make inferences about their shared parent language and its vocabulary. In this way, [word roots](#) have been found which can be traced all the way back to the origin of, for instance, the [Indo-European language family](#).

Even though etymological research originally grew from the philological tradition, nowadays much etymological research is done in [language families](#) where little or no early documentation is available, such as [Uralic](#) and [Austronesian](#).

The word *etymology* itself comes from the [Greek](#) *ἔτυμον* (*étymon*, true meaning, from 'etymos' true) and *λόγος* (*lógos*, word). The term was originally applied to the search of supposedly "original" or "true" meanings of words, on principles that are rejected as unscientific by modern linguistics. [Pindar](#) employed creative etymologies to flatter his patrons. [Plutarch](#) employed etymologies insecurely based on fancied resemblances in sounds. [Isidore of Seville's](#) *Etymologiae* was an encyclopedic tracing of "first things" that remained uncritically in use in Europe until the fifteenth century. *Etymologicum genuinum* is a grammatical encyclopedia edited at Constantinople in the ninth century, one of several similar Byzantine works. The fourteenth-century *Legenda Aurea* begins each *vita* of a saint with a fanciful [excursus](#) in the form of an etymology.

The Angelic Alphabet

by Aaron Leitch

Copyright © 1999 C. "Aaron Jason" Leitch

When John Dee and Edward Kelley received a new magickal system from Angelic beings in the late 1500s, it included information concerning the Angelic language. We have only small samples of the language: including the famed "48 Angelic Keys", and several tablets and seals containing Divine and Angelic Names. It seems to possess it's own unique grammar and syntax, as well as it's own alphabet. The Angels informed the two mages that this was the language which all Angels speak, as well as being the original language of Eden, with which Adam named (in an occult sense) all things in existence. The Archangel Gabriel tells us the following on April 21, 1583 (*A True and Faithful Relation* p. 92-3):

whereby even as the mind of man is moved at an ordered speech, and is easily persuaded in things that are true, so are the creatures of God stirred up in themselves, when they hear the words wherewithal they were nursed and brought forth: For nothing moveth, that is not persuaded: neither can any thing be persuaded that is unknown. The Creatures of God understand you not, you are not of their Cities: you are become enemies, because you are separated from him that Governeth the City by ignorance.

Man in his Creation, being made an Innocent, was also authorized and made partaker of the Power and Spirit of God: whereby he not only did know all things under his Creation and spoke of them properly, naming them as they were: but also was partaker of our presence and society, yea a speaker of the mysteries of God; yea, with God himself: so that in innocency the power of his partakers with God, and us his good Angels, was exalted, and so became holy in the sight of God [Hebrew] is not of that force that it was in his own dignity, much less to be compared with this that we deliver, which Adam verily spake in innocency, and was never uttered nor disclosed to man since till now, wherein the power of God must work, and wisdom in her true kind be delivered: which are not to be spoken of in any other thing, neither to be talked of with man's imaginations; for as this Work and Gift is of God, which is all power, so doth he open it in a tongue of power, to the intent that the proportions may agree in themselves: for it is written, Wisdom sitteth upon an Hill, and beholdeth the four Winds, and girdeth herself together as the brightness of the morning, which is visited with a few, and dwelleth alone as though she were a Widow.

Thus you see the Necessity of this Tongue: The Excellency of it, and the Cause why it is preferred before that which you call Hebrew: For it is written, Every lesser consenteth to his greater. I trust this is sufficient. The saga of the Angelic language is recorded in Dr. Dee's diaries. It begins on March 26, 1583- where the *Liber Logaeth* (Book of the Speech From God) is revealed to Kelley. The book was described as being "all full of squares" and written in a completely alien tongue. The characters used are the same ones that appear on the Holy Table of Practice, as well as the Lamens that Dee was to wear hidden away in a piece of white silk whenever he called upon the Angels.

Usually, the Angelic language is studied in it's English transliteration. Kelley had originally seen *Logaeth* written in Angelic characters, and the Archangel Raphael began the transmission of the text by naming each character one by one. However, this was an extremely tedious and time-consuming process. Dee finally asked if Roman characters could be used instead, and the Angels grudgingly consented. This was basically the last we saw of the Angelic characters.

The alphabet itself was shown to Kelley on May 6, 1583, directly upon a page in his journal, in a golden ("yellow") color. He was then able to trace the characters before the astral impression faded, and thus the alphabet was recorded for our use today. However, beyond the already mentioned Table and Lamens, there is no existing

information on how the characters might be used, or what exactly they might mean. The purpose of this essay is to address that issue, and to offer some historically sound methods of working with the Angelic letters.

Language of Power

The letters number 21, and their names were given in three sets of seven (which Donald Tyson calls "families")- suggesting a highly mystical interpretation. Below is a table of the letters, along with their names and phonetic values:

Family of Pn Family of Tal Family of Pal

B Pn (b)	M Tal (m)	X Pal (x)
K Vah (c/k)	Y Gon (i/y/j)	O Med (o)
G Ged (g/j)	H Na (h)	R Don (r)
D Gal (d)	L Ur (l)	Z Ceph (z)
F Or (f)	P Mals (p)	V Van (u/v/w)
A Un (a)	Q Ger (q)	S Fam (s)
E Graph (e)	N Drux (n)	T Gisg (t)

The largest clue to their use is suggested by the very nature of the Angelic language itself. As Gabriel explained above, it is a magickal language of power rather than an earthly spoken tongue. It is obvious that not just any text can be transliterated into the Angelic characters, nor is it to be used for everyday speech. As is evidenced by *Liber Logaeth*, it is literally a language of creative force.

It seems to me (and I am hardly the first to consider this possibility) that the characters are ultimately similar to Runes or Ogham. Like Angelic, these alphabets existed unto themselves, and were not simply fancy forms of already-existing letters. (Such as the various Hebrew-based magickal alphabets: Malachim, Passing the River, Celestial, etc. These can all be found in Agrippa's *Three Books of Occult Philosophy*.) Instead, these alphabets were used strictly for mystical purposes- to inscribe holy objects and texts. Each character is a magickal sigil over and above any relation to a phonetic value.

The Angels themselves did have a thing or two to say about Angelic writing, though it is admittedly cryptic. So far, no one has been able to discover the specific mysteries implied by their descriptions. To begin with, each letter of each word in the Keys was assigned a number- though this stopped early in the process. For instance, the word "Zorge" (Be Friendly Unto Me) was delivered as follows:

E The 6th. From the right angle uppermost to the left, 700

G The 13th. Descending, 2000

R The 17th. From the center downward, 11004

O The 32nd. Descending from the right angle to the center, 32000

Z The 47th. 194000 descending. Call it "Zorge". [Of one syllable]

The first number (6th, 13th, etc) refers to the page number in *Liber Logaeth* from which the letter was taken. Each page (or Table) of *Logaeth* represents an occult force, and the words contained in the Table are the words of creation uttered by God to manifest that force. (See Genesis I, and the many instances of "God said") Therefore, each letter of every word in the Angelic Keys was taken from a specific Table, and from a specific Word of Creation therein. Each word, then, is a compilation of various Divine Forces, making each a specific creative formula.

What follows the Table numbers in the above is anyone's guess. It seems obvious that it has some relation to the particular location of the letter on the Table. However, the pattern involved has yet to be discovered. Even if one were to number every letter on a Table (which is 49 x 49 squares large per side), you would still not come up with numbers as large as 194000. It is most likely that these numbers are not to be taken literally. For instance, it is unlikely that 194000 is actually to be understood as one hundred ninety four thousand.

When Kelley asked the Archangel Gabriel about these numbers, he replied as follows (*A True and Faithful Relation* p. 92):

Brother, what is the cause that all the World is made by numbers? The Numbers we speak of, are of reason and form, and not of merchants.

Every letter signifieth the member of the substance whereof it speaketh. Every word signifieth the quiddity of the substance. The Letters are separated, and in confusion: and therefore, are by numbers gathered together: which also gathered signify a number: for as every greater containeth his lesser, so are the secret and unknown forms of things knit up in their parents: Where being known in number they are easily distinguished, so that herein we teach places to be numbered: letters to be elected from the numbered, and proper words from the letters, signifying substantially the thing that is spoken of in the center of his Creator, whereby even as the mind of man is moved at an ordered speech. [etc].

Gabriel is, of course, discussing the gathering of the letters from their various positions in *Logaeth*. He also implies the concepts of Gematria- where occult meanings and relationships between words can be discovered by finding their numerical values. However, Gematria depends on assigning numbers to each letter of the alphabet, and applies most directly to languages that use their alphabetic characters as a number system as well. Thus, in Hebrew, the letter "Gimel" has the phonetic value of "G" as well as the numeric value of three. The letters in any Hebrew word can be added for a numeric total- which can then be worked with after the fashion of numerology.

Angelic characters are not given any such values. In fact, any given Angelic letter might be related to many different numbers throughout the text of the Keys. For instance, we have such examples as the following:

Os = 12 Mapm = 9639 Acam = 76999

Cla = 456 Af = 19 Ni = 28

Pd = 33 Peol = 69636 Ox = 26

This merely scratches the surface of the odd numbers that appear in the Angelic Keys. It also serves to illustrate the complications in attempting to create a system of Angelic Gematria. Finally, it sheds no light at all upon the large "positional" numbers given with the letters of the Keys. It is very possible that any form of Angelic Gematria will have to come from that system, utilizing *Liber Logaeth* itself.

Of The Names Of Spirits

With Gematria being left on the back burner for now, we are left to question other possibilities of working with the Angelic language. Beyond what Gabriel tells us above, the diaries are silent concerning the sigil-like nature of the characters. However, it is possible to study the methods used by mages of the past in working with their sacred alphabets. Even John Dee himself was familiar with several techniques- mainly concerning the use of

Hebraic characters- which may have been exactly what Gabriel was referring to when he stated: "it is preferred before that which you call Hebrew."

The *Three Books of Occult Philosophy*, written by Henry Cornelius Agrippa in 1509 CE, has been invaluable to my own studies of the Angelic (or "Enochian") material. It is well known that Dee himself owned a copy, and that elements of that work can be found throughout his Angelic system of magick. The book is even mentioned once in the diaries, in connection with the reception of the 91 (or 92) Parts of the Earth. Therefore, when we are faced with such an enigma as the Angelic alphabet (and how to use it), it makes sense to return to this source material- to see what Agrippa had to say concerning sacred alphabets and characters.

The relevant sections of Agrippa's work are contained in Book Three, and begin with a chapter entitled, appropriately enough, *Of The Tongue Of The Angels, And Of Their Speaking Amongst Themselves, And With Us* (Ch. 23). No doubt this was of profound interest to Dee and Kelley. Over the next few chapters, we are taught various methods of discovering and formulating names for Angels and spirits set over anything in existence. They include everything from obtaining the names in a code-like fashion from sacred scripture to creating new names through various Qabalistic cipher tables. He tells us in chapter 24:

But the masters of the Hebrews think that the names of angels were imposed upon them by Adam, according to that which is written, the Lord brought all things which he had made unto Adam, that he should name them, and as he called anything, so the name of it was. Hence, the Hebrew mecubals think, together with magicians, that it is in the power of man to impose names upon spirits, but of such a man only who is dignified, and elevated to his virtue by some divine gift, or sacred authority.

But because a name that may express the nature of divinity, or the whole virtue of angelical essences cannot be made by any human voice, therefore names for the most part are put upon them from their works, signifying some certain office, or effect, which is required by the quire of spirits: which names then no otherwise than oblations, and sacrifices offered to the gods, obtain efficacy and virtue to draw any spiritual substance from above or beneath, for to make any desired effect.

Of course, Agrippa uses Hebrew throughout the text to illustrate the various methods of name generation. However, he also states the following in chapter 27:

because the letters of every tongue have in their number, order, and figure a celestial and divine original, I shall easily grant this calculation concerning the names of spirits to be made not only by Hebrew letters, but also by Chaldean, and Arabic, Egyptian, Greek, Latin, and any other, the tables being rightly made after the imitation of the precedents.

This kind of philosophy takes on a deeper significance when we remember that Dee and Kelley were reading this in 1583. It sheds much light on Gabriel's statement that Angelic "is preferred before that which you call Hebrew." My proposal is twofold: In the first place, the Angelic alphabet can be used in place of Hebrew in the various calculatory methods. In the second place, there is reason enough to believe that the alphabet might have been meant for use in just this fashion.

Of Finding Out The Names of Spirits, And Geniuses From The Disposition Of The Celestial Bodies

Such is the name of chapter 26, book three, of Agrippa's *Occult Philosophy*. This technique is one that I find extremely fascinating, yet it has been a largely ignored subject in current magickal literature. The chapter begins as follows:

The ancient magicians did teach an art of finding out the name of a spirit to any desired effect, drawing it from the disposition of the heaven; as for example, any celestial harmony being proposed to thee for the making an image or ring, or any other work to be done under a certain constellation thou will find out the spirit that is the ruler of that work

A vitally important aspect of renaissance magick was the observance of astrological forces. In fact, a large portion of classical occult literature is devoted to magickal timing based upon the results of natal chart interpretations. Just as John Dee used this art to schedule a time for the Queen's inauguration ceremony, so too would he have cast horoscopes to determine the best times for his magickal operations.

In this way, strict magickal timing was often observed- during which various shamanic workings could be done. This included astral trips, spirit work, the fashioning of talismans, divinations, etc- all without much use of ceremony. The natural astrological forces of the time, along with the right prayers (perhaps some incense and holy water) was all that this form of magick required. It is from these practices that we hear of spirits ruling for limited periods of time, and texts that suggest spirits can only be contacted under specific astrological conditions.

The process outlined by Agrippa begins with this step- casting a natal chart for the desired time of working. If a chart shows itself to be particularly bad, it is assumed that one will automatically cast a new chart and reschedule. Once the final chart is drawn, it is first necessary to calculate the degree of the ascendant. Agrippa has us, then, place the Hebrew letter Aleph in that degree, and continue to write the alphabet all the way around the chart. Each degree is assigned a single letter, and the direction is counterclockwise to follow the natural course of the twelve zodiacal signs. When the end of the alphabet is reached, one simply begins anew with the letter Aleph, and continues onward until all 360 degrees have been filled. (It is highly unlikely that anyone would actually draw a chart massive enough to display all 360 letters. However, with the number of letters in the alphabet being known [Hebrew = 22, Angelic = 21] one can easily calculate the proper letter for any given degree).

From there one only needs to interpret the chart as normal, making distinctions between the planets with good dignities and those with bad. The concept is to focus on the specific forces one needs most for the work at hand- in a fashion not at all unlike talismatic imaging. Ignoring the weaker and negative aspects of the chart, one can "compile" those forces that are necessary to the magickal goal. These are, in a literal sense, the Forces (and thus Gods, Angels, etc) which one is attempting to call upon.

Each degree which contains a desired aspect of the chart now has a letter associated, and these are gathered together to formulate a name. The ordering follows the same pattern as above- begin at the ascendant, and continue counterclockwise from there. The letters of the name fall in order as they are encountered along the way.

A "qliphothic" name can also be derived using the same process. However, the entire process must be followed clockwise, or against the natural order of the signs. Agrippa also suggests that some began this counter-process from the degree of the descendent, rather than the ascendant. The text goes on to give further methods of performing the same process, though I leave study that for the aspiring student.

The name that is thus derived is the genius or intelligence set over that specific time, and the mage's magickal work. Agrippa explains that this method can even be used to find the name of one's personal genius, or (as we call it today) the Lesser Guardian Angel. This is the Angel you learned about while growing up- who sits on your right shoulder and attempts to talk you out of bad deeds. This is the Guardian Angel that is often credited with keeping people from physical harm. Also, as Agrippa explains, this is the Angel set over your home, career, and all such mundane aspects of your life. I should note that this is not the Holy Guardian Angel described in the Book of Abramelin, who is more concerned with your ultimate spiritual evolution.

As for calculating the Lesser Guardian's name, one only needs to construct their own natal chart, and proceed as instructed above. To make the name proper in a Qabalistic sense, one must append the name with "El" or "Yah" in the style of the Shem haMephoresh. On the other hand, it would seem that this is not necessary when working with something other than one's personal genius. However, if one is using the Angelic alphabet, there should be no need for this convention in any case.

Of The Calculating Art Of Such Names By The Tradition Of Cabalists

This is the name of chapter 27 in the *Third Book of Occult Philosophy*. This section gives us further methods of working with the name obtained via the methods of chapter 26. It involves permutating the name of the intelligence to discover an entire hierarchy of Angels who rule above the intelligence himself. It is possible to generate nine such names- one for each of the nine traditional Angelic Choirs: the Angels, Archangels, Principalities, Virtues, Powers, Dominations, Thrones, Cherubim, and Seraphim. (See Agrippa, Book II, Ch. 12: *Of the Number of Nine, and the Scale Thereof*).

To begin with, I will illustrate the table used in this procedure, replacing the Hebrew with Angelic characters:

Table of the Seven Planets

	Luna	Merc	Ven	Sol	Mars	Jup	Sat	Good
T	B	K	G	D	F	A	E	B
S	M	Y	H	L	P	Q	N	K
V	X	O	R	Z	V	S	T	G
Z	B	K	G	D	F	A	E	D
R	M	Y	H	L	P	Q	N	F
O	X	O	R	Z	V	S	T	A
X	B	K	G	D	F	A	E	E
N	M	Y	H	L	P	Q	N	M
Q	X	O	R	Z	V	S	T	Y
P	B	K	G	D	F	A	E	H
L	M	Y	H	L	P	Q	N	L
H	X	O	R	Z	V	S	T	P
Y	B	K	G	D	F	A	E	Q
M	M	Y	H	L	P	Q	N	N
E	X	O	R	Z	V	S	T	X
A	B	K	G	D	F	A	E	O
F	M	Y	H	L	P	Q	N	R
D	X	O	R	Z	V	S	T	Z
G	B	K	G	D	F	A	E	V
K	M	Y	H	L	P	Q	N	S
B	X	O	R	Z	V	S	T	T
Evil	Sat	Jup	Mars	Sol	Ven	Merc	Luna	

This table consists of two outer columns and seven inner columns. The right-hand outer column (marked "good") is called *The Entrance of the Good Angels*, and includes the Angelic alphabet written in order from top to bottom. The left-hand outer column (marked "evil") is called *The Entrance of the Evil Angels*, and includes the Angelic alphabet written in reverse order. The center columns include the alphabet written from left to right, in seven letter sections, repeating all the way to the bottom of the table. Each of these seven columns is assigned one of the Planetary forces.

In order to use this table, one must enter the desired name (i.e.- that obtained from the natal chart) into the proper outer column. Those names taken from the ascendant counterclockwise will enter from the right, and those taken from the descendent counterclockwise will enter from the left. To illustrate the process, I will use the Angelic name of "Madimi". (This was an Angel that appeared to Dee and Kelley quite often.) We will pretend that we have generated this name via an astrological chart. The following illustrates Madimi's name in Angelic characters, along with some fictional planetary attributes as if taken from the degrees of our chart.

M **M** Mars
 A **A** Sol
 D **D** Mercury
 I **Y** Jupiter
 M **M** Venus
 I **Y** Luna

In this example, we would assume that these six planets fell in favorable aspects, while Saturn somehow fell weakly or negatively and was thus excluded. Madimi being a good Angel, we would look for the M (Tal) in the right-hand column. Tal is associated with Mars in this instance, therefore we scan to the center column of Mars. There we find the letter P (Mals), which becomes the first letter of the new name. The next letter of Madimi's name is A (Un), and is associated with Sol. Finding Un in the right-hand column and moving across to the column of Sol, we find the letter Z (Ceph). The process continues in this pattern until we run out of letters. For ease of study, I will illustrate the new name as it appears in Angelic characters:

P **P** Mars
 Z **Z** Sol
 K **K** Mercury
 S **S** Jupiter
 H **H** v Venus
 X **X** Luna

This process has granted us a new Angelic name. The name "Pzkshx" is merely the first of nine possible names that can be generated with this table, and (according to Agrippa) is a member of the Angelic Choir known as the "Angels". This name can then be entered into the table just as we did with Madimi, to generate a name for the next Angelic Choir, the Archangels: This can then be entered into the table to generate a name for the Principalities. The process can continue until you reach the choir of Seraphim. For the purposes of practical magick, I will add the descriptions of the powers of each Hierarchy as given in the *Book of the Sacred Magic of Abramelin the Mage* (Dover, p. 260-1)

The Order of the First Hierarchy (Seraphim, Cherubim, Thrones)

The spirits of the Seraphim serve to make thee respected and loved for works of Charity, for that which regardeth honors and other similar things. In matters of great importance they themselves act; but for matter base and carnal, it is their subjects who do serve and operate.

The Order of the Second Hierarchy (Dominions, Virtues, and Powers)

The property of the Dominions is to dominate; to procure liberty; to vanquish enemies; to give authority over Princes, and over all kinds of persons, even Ecclesiastics. The Virtues are proper to give strength and force in all matters whether of War or Peace; and in all Operations concerning the health of men, and in all maladies for which the fatal hour hath not yet been written. The Powers have the dominion over all the Inferior Spirits; and this is why they can serve in all things in general, good or evil, and they be straight and right in execution, very punctual, very prompt, and exact in their Operations.

The Order of the Third Hierarchy (Princes, Archangels, and Angels)

The Princes comprise Spirits capable of giving Treasures and Riches, and they or their dependants serve in all the Operations, being a mass composed of different Orders, and they are sufficiently truthful. The Archangels be proper to reveal all Occult matters, and all kinds of secret things, such as obscure points in Theology and the Law. They serve with great diligence. The Angels in general do operate each one according unto his quality. There be an infinite number of them. They command the Four Princes and the Eight Sub-Princes [of the Qliphothic hierarchy] in all kinds of Operations.

And this ends our exploration of Agrippa-style name generation, utilizing the Angelic alphabet "before that which we call Hebrew". What I have outlined here merely scratches the surface of possibilities to be found within the *Three Books of Occult Philosophy* as well as other bodies of classical magickal literature. I invite the reader to continue this research, and to see which methods generate the most useful Angelic names.

Agrippa ends chapter 26 with the following. I have decided to sign off my own essay with these words, as I feel that Dee himself likely read them and took them close to heart:

And these names being thus distributed according to the proportioned numbers to the starry account, [] whilst the mind being astonished at the obscurity of them, and deeply intent, firmly believing that something divine is under it, doth reverently pronounce these words, and names, although not understood, to the glory of God

Enochian is a language. It expresses, through a semiotic apparatus, a constellation of impressions, ideas, and conceptions in context to a world be it spiritual, physical, or somewhere between. This is an exceedingly broad understanding of language and in the case of Enochian it is necessary to be broad. Aside from this broad view Enochian adheres to very few linguistic rules in a consistent manner.

It seems to have all the trapping of a natural language. It has some structures of case, or a root system, or declensions, conjugations, enclitics, inflections, and a consistent vocabulary - yet all these seem to be so highly irregular (or so complex) that any method of making systematic sense of them is fruitless. Surely, this owes, in great deal, to the small volume of text in the language. The conjugation of the verb "I say" will make the first strata (the truly linguistic aspect) clear while the numerical system will show the latter (how the system seems to make little or no sense).

It is clear that it has some grammatical forms and consistent vocabulary which makes it extremely tantalizing. Due to the highly liturgical nature of the calls it is not possible to glean enough evidence from the texts to provide us with a better mode of critical attack on the language itself. In the end, we are left with the calls of which can be said that they are apocalyptic in nature (like much of the sessions with the spirits) and seem to deal with a final judgment by G-d upon the world.

Regarding Orthography and Phonology, the language contains 21 letters virtually all pronounced like English. There are hard and soft vowels; consonants usually adhere to English rules of pronunciation, and there are no signs of verifiable non-English sounds (such as those found in Semitic languages for instance).

Enochian seems to use a root system in that a base form is augmented with prefixes and suffixes to determine grammatical forms. This is the way in which Enochian expresses verb forms:

OM = possible root for "to understand", "to know"

OMa = "understanding" - Substantive form

OMax = "know" verb form for second person singular

ixOMaxip = "Let it be know" a passive verb form. This form is actually similar to the Hophal form in Hebrew in expression although not in construction.

Enochian tends to show a cross current of linguistic apparati. There is some evidence of case (which was already lost in English by Dee's day although his knowledge of Latin would make him used to dealing with such a linguistic system) in Enochian. There is a nominative, accusative, comparative, genitive, dative, and possibly an instrumental/ablative. The problem in establishing clear cases grammar (or really the sure existence of case) is the sheer lack of text. There only exist around 250 words and over half of those only occur once. Normal conversational language requires around 300 to 500 words and the second language is clearly not conversational. It is highly liturgical, very theological technical, and extremely economic with a single "Enochian word" being rendered for long strings in English. Sometimes, in contrast to this case theory, there are a copious amounts of

particles and prepositions which do not seem to alter the inflected word which is indicative of a case-less language although the irregularity of particles does not speak to a particle based language.

Caosg(a) - Earth
Caosg(a) - non. sing.
Caosgi - acc. sing.
Caosgin - comp sing.
Caosgo - gen. sing.
Caosgon - dat. Sing

At it has been pointed out by others, Enochian seems to show some signs of etymology. Biblical words in defective forms are often linked in syntax to Enochian words. Known examples are:

angelard - though (from "angel")
chriteos - let there be (from "Christ" or the Greek form)
nazarth - pillars of gladness (from "Nazareth")
luciftias - brightness (from the Latin "lux, lucis" or directly from "lucifer")

It has some structures of case, or a root system, or declensions, conjugations, enclitics, inflections, and a consistent vocabulary - yet all these seem to be so highly irregular (or so complex) that any method of making systematic sense of them is fruitless. Surely, this owes, in great deal, to the small volume of text in the language. The conjugation of the verb "I say" will make the first strata (the truly linguistic aspect) clear while the numerical system will show the latter (how the system seems to make little or no sense).

There are some partial conjugated forms. There seems to be three tense (past, present, and future (perhaps an imperfect). Passive and Subjunctive forms exist although in no consistent manner. An example:

The root appears to be GOH- with suffixed forms to indicate conjugation much like Latin or Old English.

GOHUS - I say (1 Present. Singular. Active.)
GOHE - He says (3 Pres. Sing. Act.)
GOHIA - We say (1 Pres. Plural. Act.)
GOHOL - Saying (possible gerundive form, participle)
GOHON - They Have Spoken (3 Imperfect. Plu. Act.)
GOHULIM - It is Said (3 Sin. Passive.)

The being verb in various forms:

ZIR (ZIRDO) - I Am (1 Pres. Sing. Act.)
GEH - You Are (2 Pres. Sing. Act.)
I - He/She/It Is (3 Pres. Sing. Act.)

CHIIS (CHIS) (CHISO) - (3 Pres. Plu. Act.)

AS (ZIROP) - Was (past/perfect sing. particle? Act.)
ZIROM - Were (past/perfect plu. particle? Act.)
TRIAN - Shall be (future/imperfect intensive? sing/plu particle? Act.) * In Dee's time the use of "shall" was not grammatically limited to 1 sing/plu act. as some English grammars indicate.

BOLP - Be Thou (Imperative)

IPAM - Is Not (Pres. sing. Act. Negation).

IPAMIS - Cannot Be (Pres. sing. Neg. linked with an infinitive form?)

There is no evidence of a dual form. Needless to say, a very scant grammar. It is impossible to recreate forms based on other examples due to the paucity of examples and the irregularity of the present ones. Possible roots include ZIR and IPAM although this is tenuous. The verbs appear to occur in combination with pronoun particles (like caseless languages).

Pronoun include:

OL - I

ILS (G) - You

TOX (TBL) - Of Him (Genitive? Possessive?)

TIA - His (adjectival form)

PI - She

TIBL - Her (Accusative?)

TIOBL - In Her (Ablative or Locative?)

Z - They

Possible roots here are TBL with a possible I infix for Fem. gender. If this is the case, this is an example of infixing. There are no articles to speak of although there are some demonstrative forms which act similarly.

The language is concerned with apocalyptic revelations many of which contain numerical importance. There are also overtones of mystical numerology. There seem to be several names for single numbers (the number 1 has at least six different forms, the number 2 at least three.)

Enochian Alphabet, Gematria & Letter Essences

In Meric Casaubon's: A True and Faithful Relation of What Passed for so Many Years Between Dr. John Dee and Some Spirits, we get the following quote:

Gabriel...Every Letter signifieth the Member of the substance whereof it speaketh. Every word signifieth the quiddity of the substance. The Letters are separated, and in confusion: and therefore, are by numbers gathered together: which also gathered signify a number: for as every greater containeth his lesser, so are the secret and unknown forms of things knit up in their parents: Where being known in number they are easily distinguished, so that herein we teach places to be numbered: letters to be elected from the numbered, and proper words from the letters, signifying substantially the thing that is spoken of in the center of his Creator, whereby even as the mind of man moved at an ordered speech, and is easily persuaded in thing that re true, so are the creatures of God stirred up in themselves, when they hear the words wherewithal they were nursed and brought forth: For nothing moveth that is not persuaded: neither can anything be persuaded that is unknown.

Drawing on the quote and recognizing that every letter contains an essence of substance, Patricia Shaffer's 'Letter Essences' are also included. To quote from the introduction to her work:

These are the essences, which I have attributed to the individual letters. As I understand it, each letter represents a sound, which is universal to the mind of man, and so, the essential meaning echoes within every spoken language. The shapes of the letters or glyphs may vary, but the sound is what imparts the meaning. Each of the individual letters reflects a pure sound, but certain combinations (e.g., ch, sh, ph) give mixed sounds, and thus, the meanings of such dyads are subtly enhanced.

Note that she differentiates between the letters I and Y as well as U and V. But her take on using sounds to represent archetypal qualities in human consciousness is not all that different from the symbolic representation of the English alphabet in Liber 805.

V	B	Pe	1	Root of Choice: duality, multiplicity, choose (between)
l3	K	Veh	2	Root of Causation: make, cause, create, because (of) ¹
6	G	Ged	3	Root of Negation: not, none, nothing, nor
2	D	Gal	4	Root of Possibility: possible, potential
7	F	Orth	5	Root of Manifestation: manifest, show, appear
